- K.

The wonder material

- Large mobility ($>10^5 \text{ cm}^2/\text{Vsec}$)
- Transparent ($>90\%$ transparency for a single monolayer)
- Large thermal conductivity
- Mechanical properties:

FLEXIBLE AMOLED
 Super Slim & Flexible
 Skin Phone with Graphene SP AMOLED
 Natural User Interface

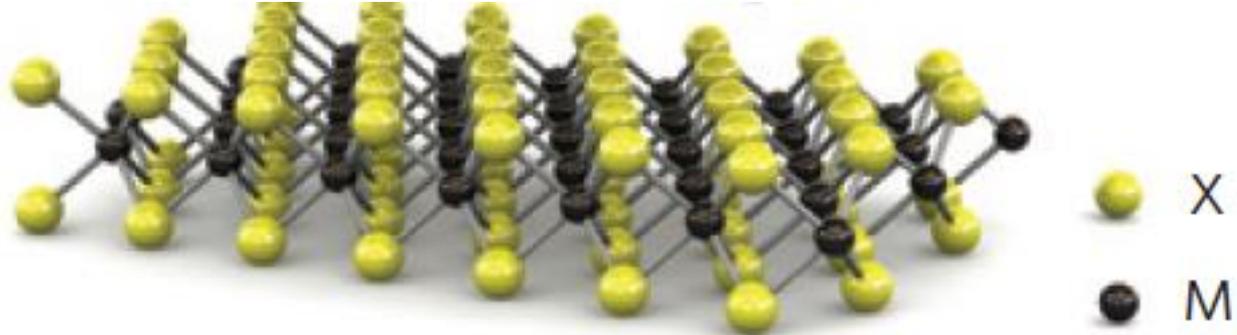

“Killer Application”

Transition metal dichalcogenides (TMDCs)

■ Formula:

M: Transition metal

group IV: Ti, Zr, Hf, ...

group V: V, Nb, Ta, ...

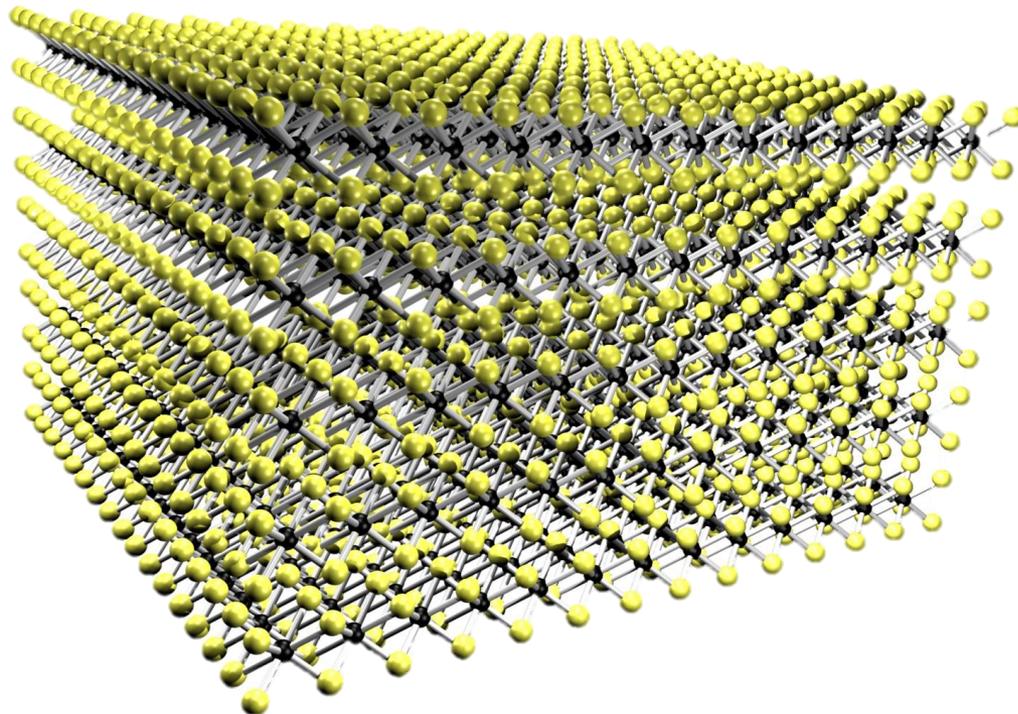

group VI: Mo, W,

X: chalcogenide: S, Se, Te

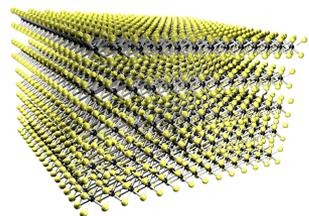

Energy gap 1-2 eV

conducting

semi-conducting

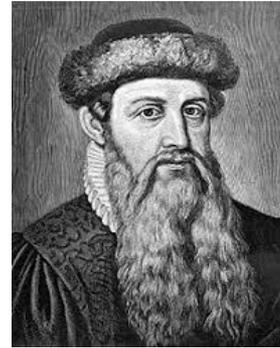

insulating

motivations

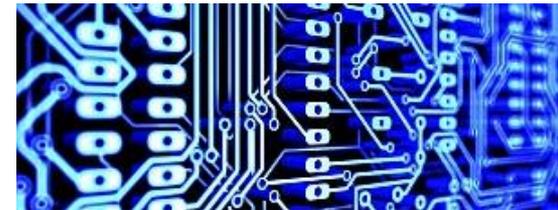

- The Development of printing techniques has paved the way towards mass production of books, leading to the ***democratization of knowledge***.

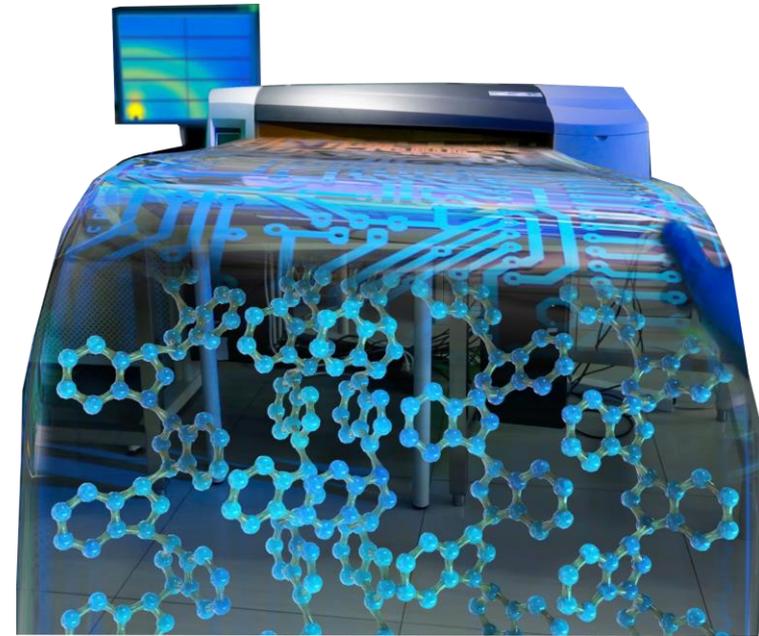

- **Desktop printing (early '80)** as a corner stone in the history of printing (*just-in-time*, wide-spread, i.e., offices not typographies)

- However, so far, this technology has mainly been limited to the printing of documents (books, magazines, etc.), but, ***what about if, in the ICT era, we managed to extend printing technologies also to fabricate electronic circuits?***

the vision

■ to cheaper, fully customizable, distributed desktop fabrication

■ from expensive, huge, specialized semiconductor fabs

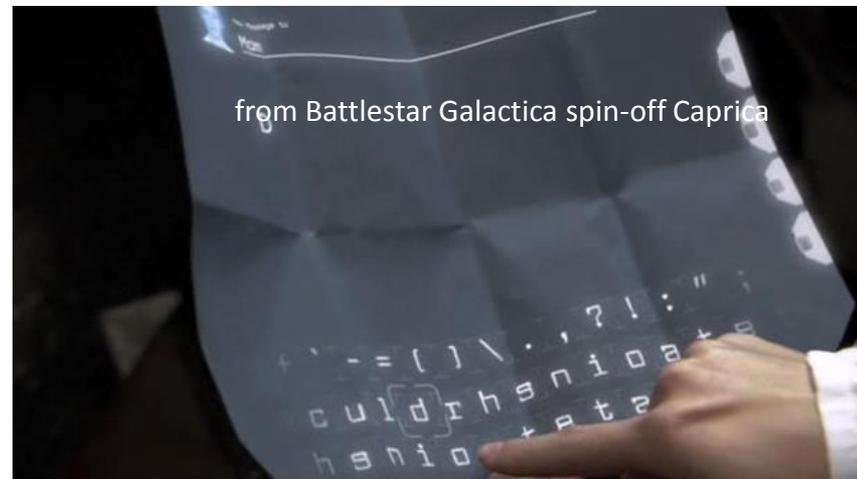

the vision

- Today

Rigid, produced in series, not customizable
(designed by somebody else than the user)

- Tomorrow

Flexible, foldable, fully customized, designed and
fabricated by the user (and cheaper)

.... and on paper

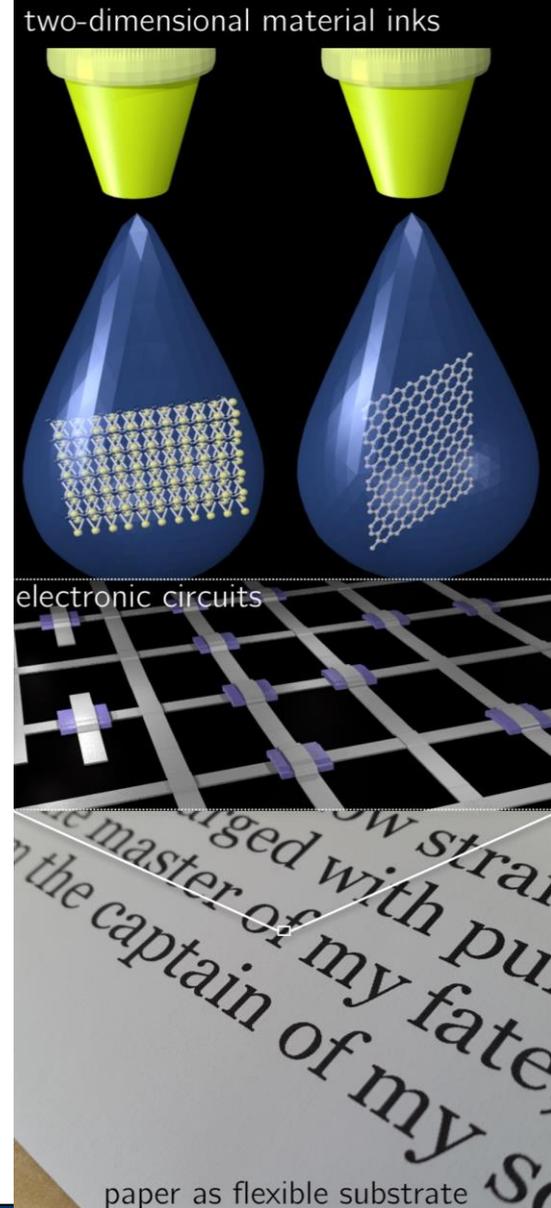

- **Why 2DMs?** current inks with limited mechanical (poor bendability, $\epsilon < 3\%$), electrical properties ($\mu < 10 \text{ cm}^2/\text{Vs}$) and stability.

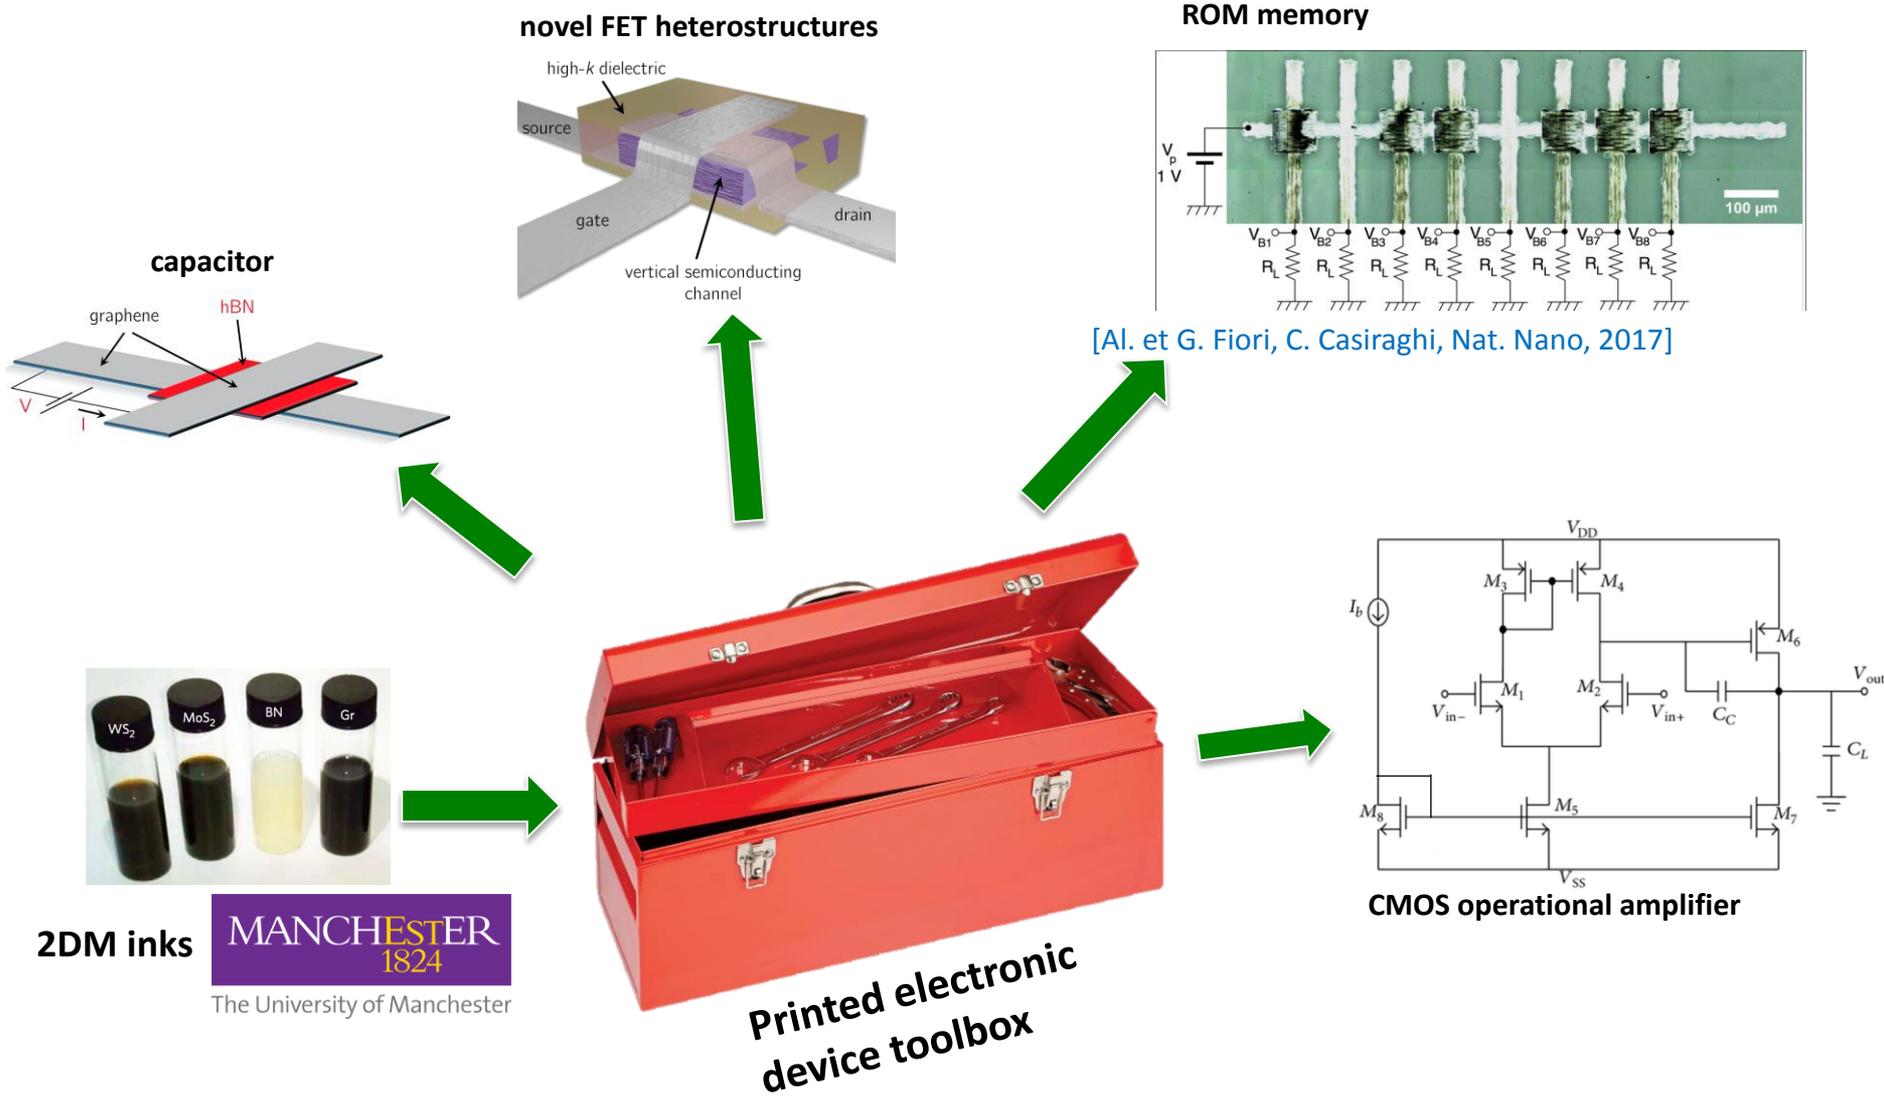

- **2DMs can be the “game changer”:**

- extraordinary mechanical ($\epsilon < 10\%$), electrical properties ($\mu > 10 \text{ cm}^2/\text{Vs}$).
- plethora of materials (i.e., semiconducting, conducting and insulating).
- Heterostructures.

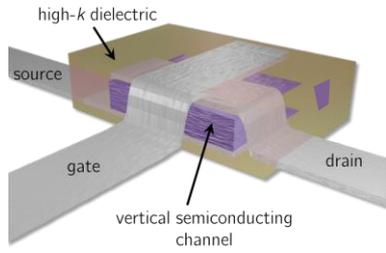

- **Why now?** Recently demonstration [Al. et G. Fiori, C. Casiraghi, *Nature Nano.*, 2017] of water-based bio-compatible 2DMs inks, enabling *heterostructure fabrication*.

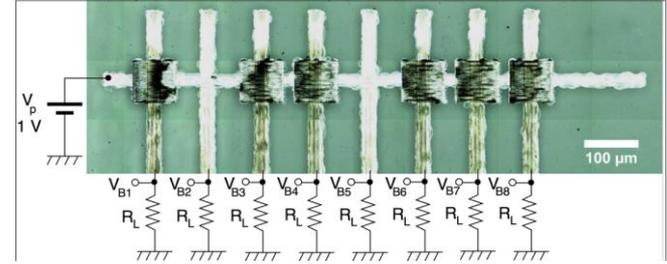

the vision *beyond* state-of-the-art

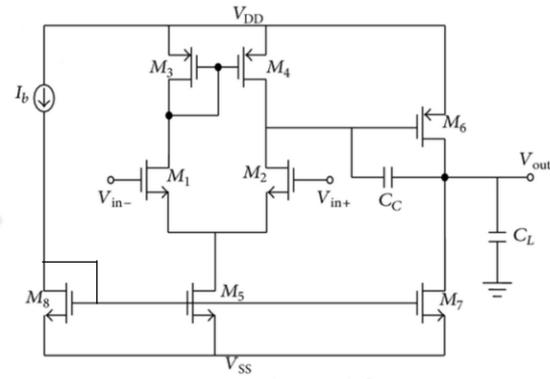

novel FET heterostructures

ROM memory

[Al. et G. Fiori, C. Casiraghi, Nat. Nano, 2017]

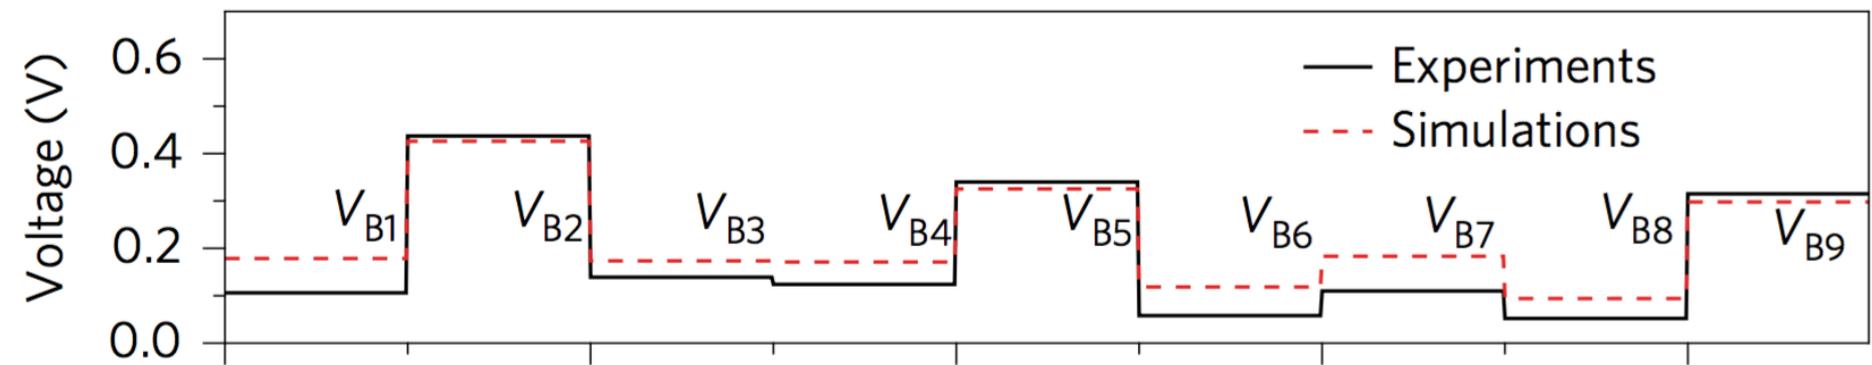

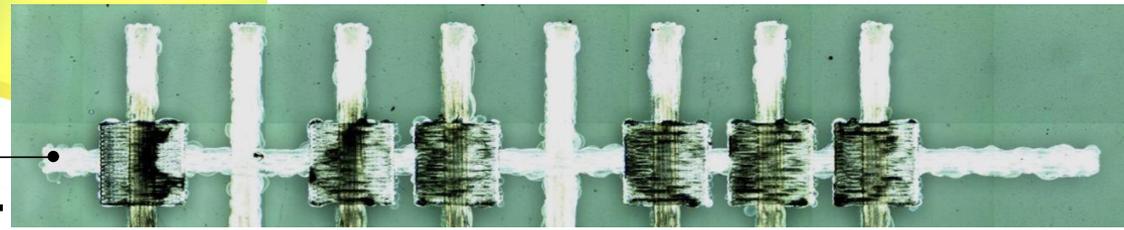

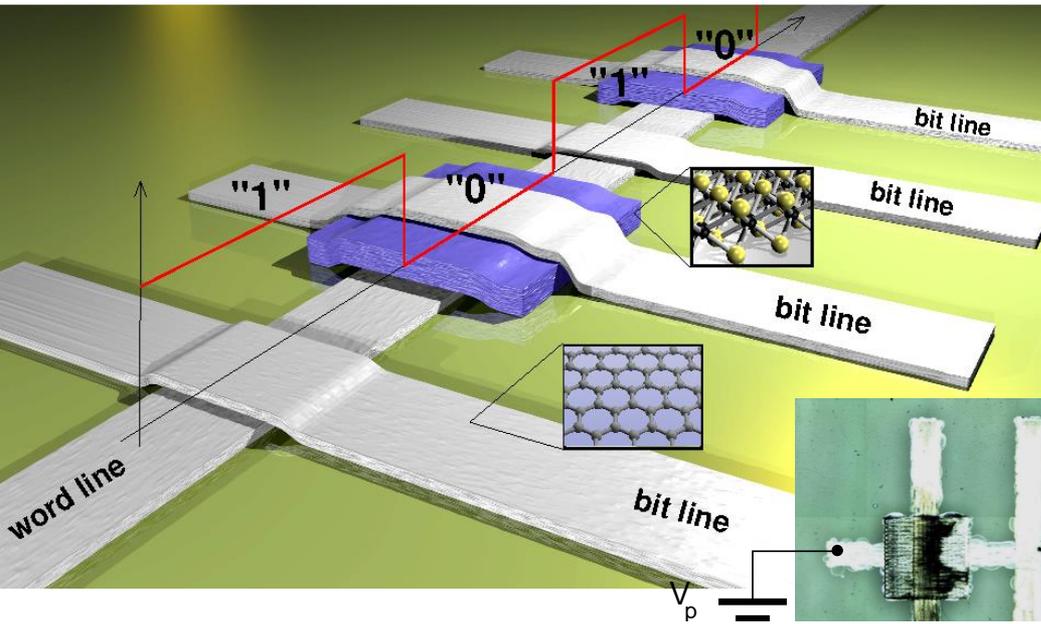

CMOS operational amplifier

Printed electronic device toolbox

2DM inks

MANCHESTER 1824
The University of Manchester

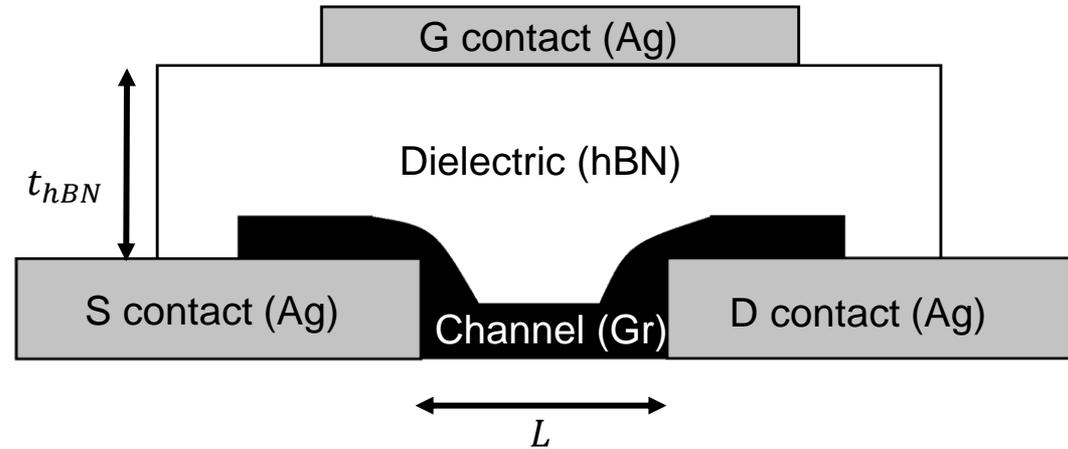

[D. McManus et al. Nat. Nanotechnology, 2017]

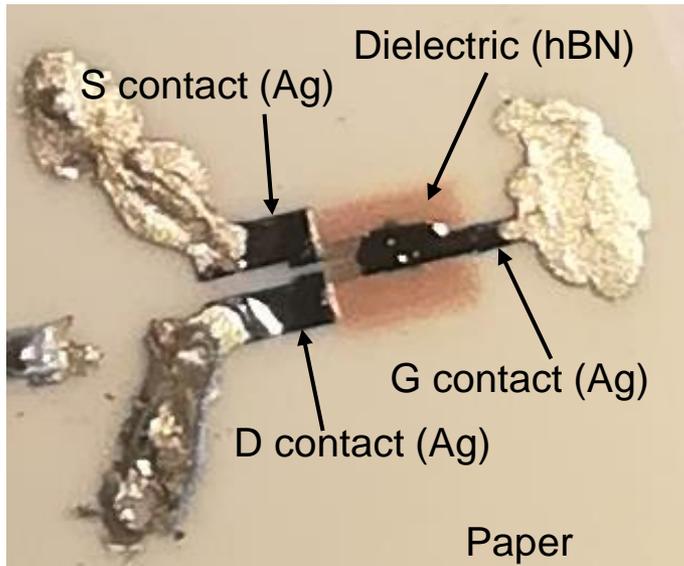

Proof of concept: 2D-based Inkjet ROM

Joint collaboration between University of Manchester
(C. Casiraghi) and University of Pisa

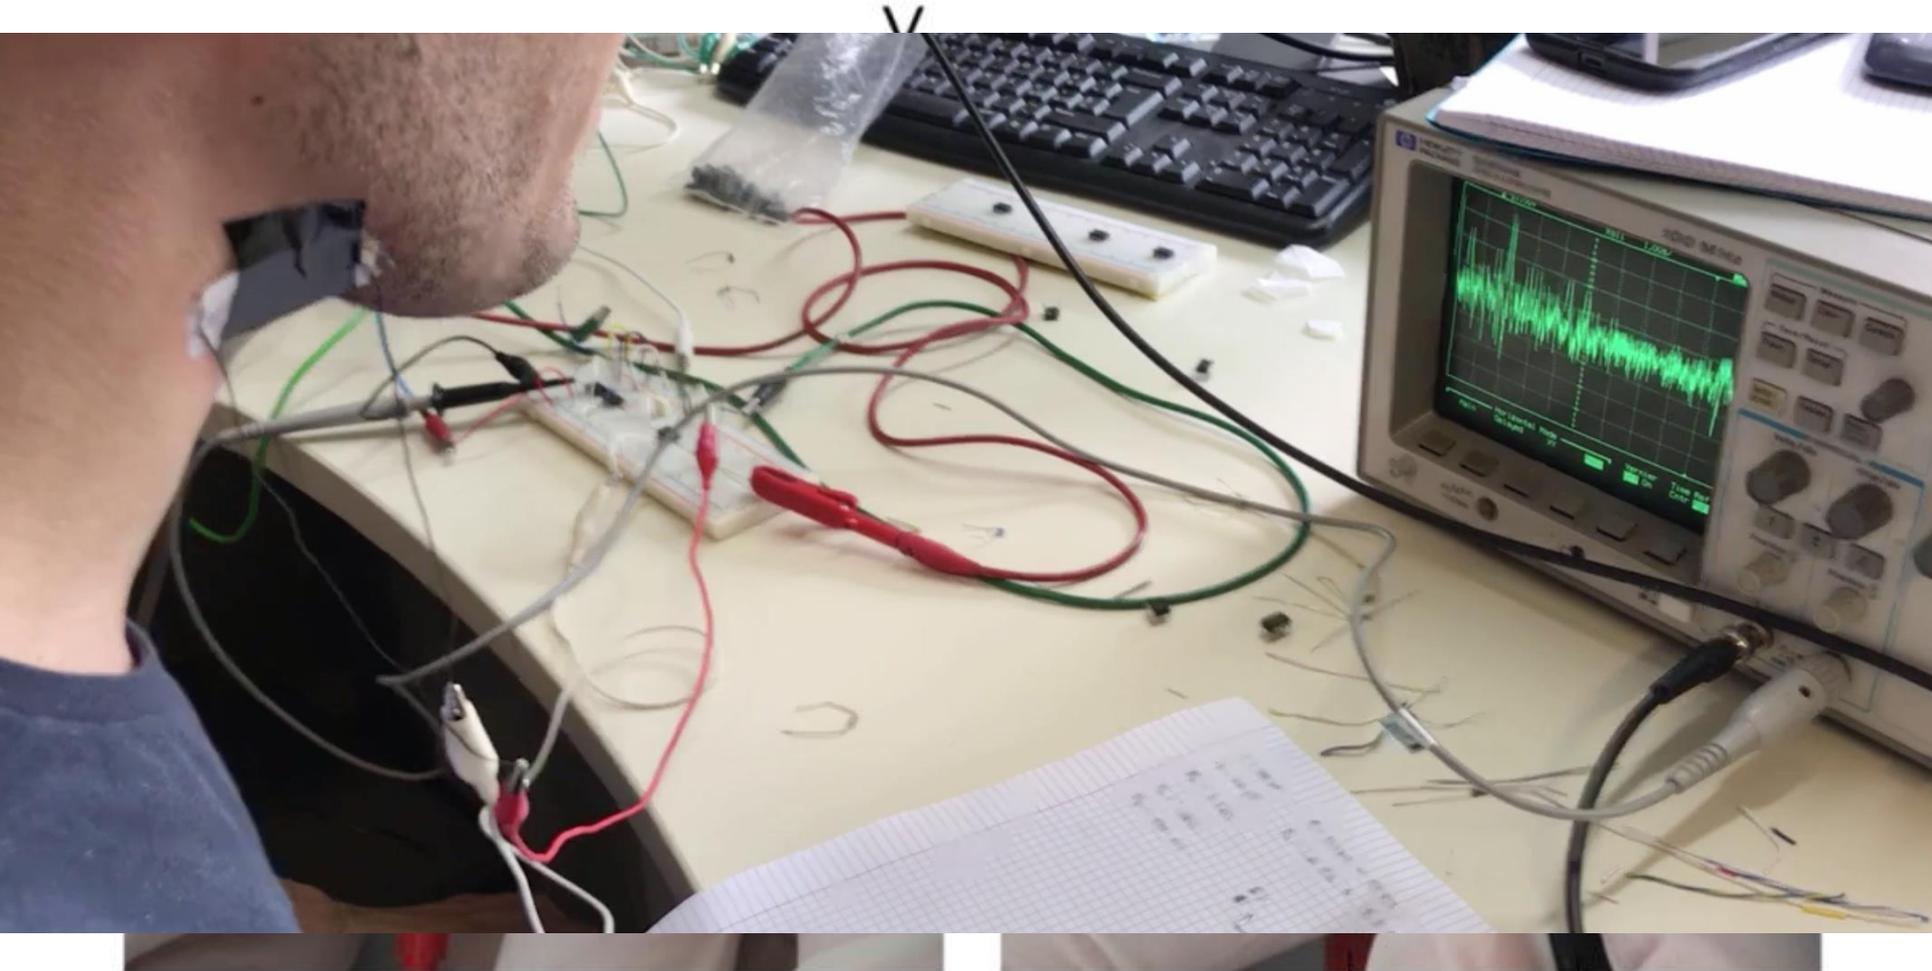

- ❑ Printed on paper.
- ❑ Structure:
 1. S and D contacts (Ag);
 2. Channel (Gr);
 3. Dielectric (hBN);
 4. G contact (Ag).

Schematic cross section

- Channel parameters: $\begin{cases} L \approx 70 \mu\text{m} \\ W \approx 500 \mu\text{m} \\ R \approx 10\text{K}\Omega \end{cases}$

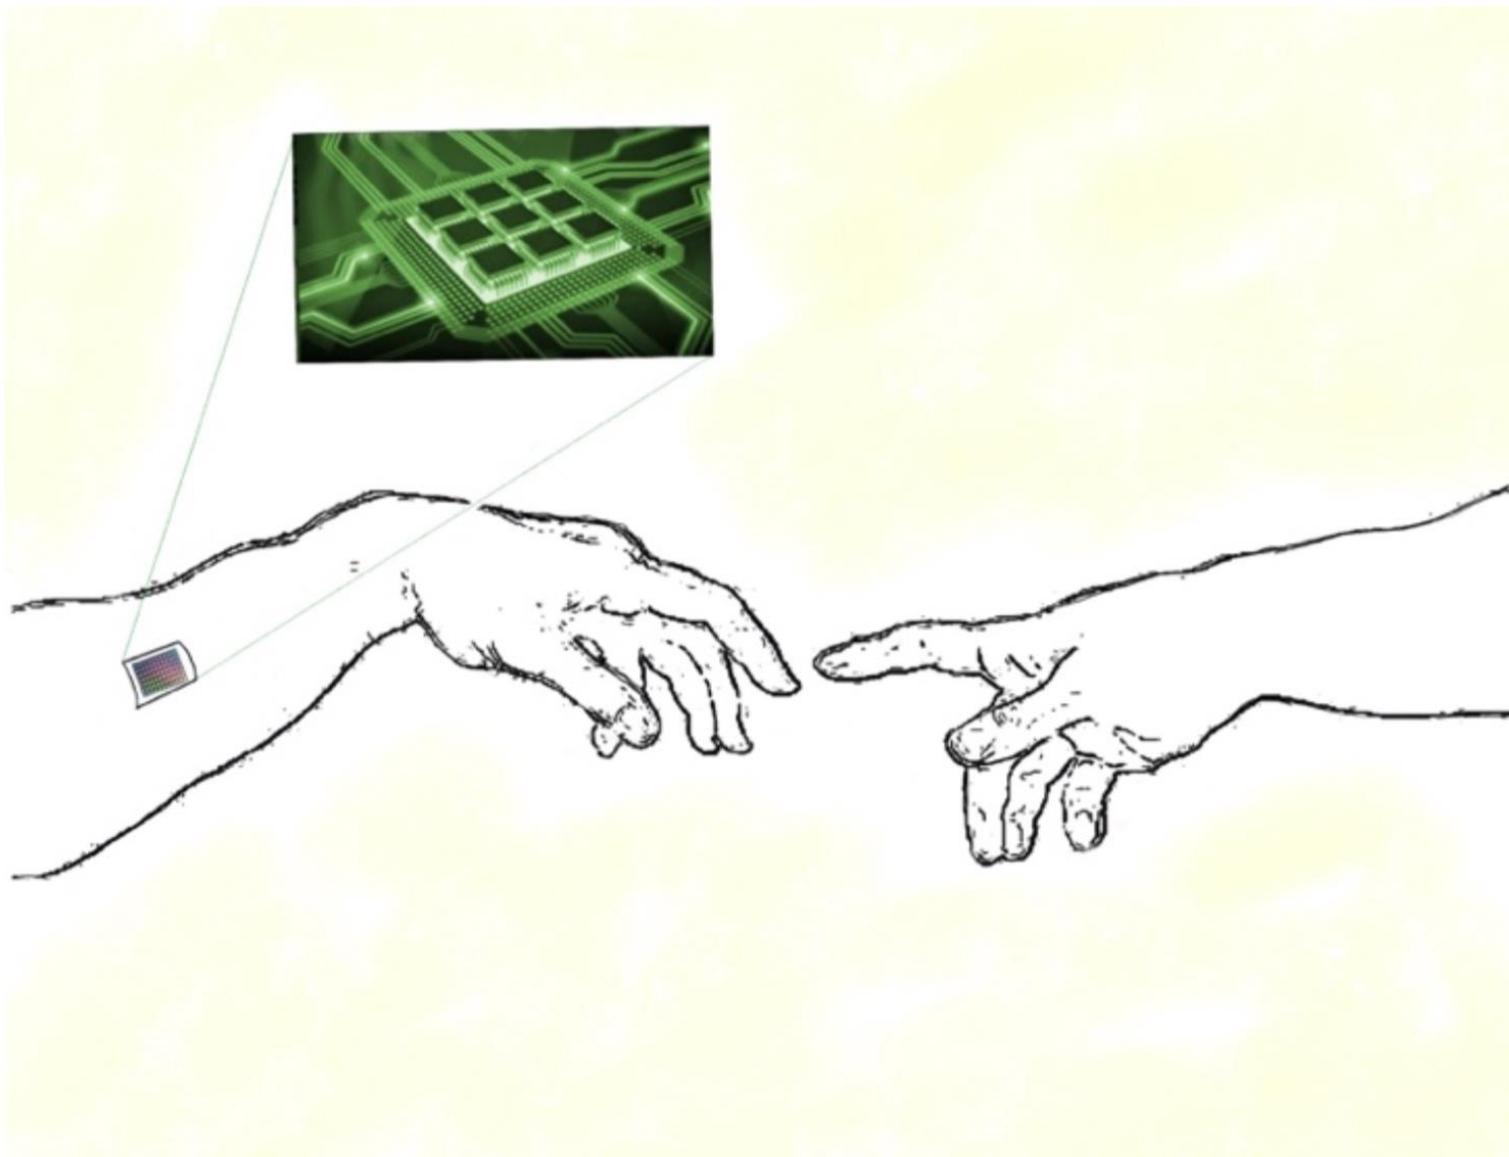

Strain gauge
